

# HOW MOBILE INTERNET TELEPHONY WORKS

- 1** User buys a mid-end (Java-enabled) or a high-end (Symbian, Linux or Windows Mobile) phone

- 2** User registers his/her phone number on the website of application-providers such as Fring.com, Nimbuzz.com

- 3** User gets an SMS from the application provider with a link to download the messenger application

- 4** User downloads and installs the application

- 6** The application checks with the main website to see who in the contacts list is registered for the service

- 5** The application searches the user's phone for his contacts list

- 7** User can now make free\* text, voice and video calls to those who are registered for the service, anywhere in the world

(\*Calls will be free for users of unlimited data plans; for others, operators will charge for data usage at the same rate as when they are browsing the Internet)
